Quiz Submissions - Midterm Exam	
Attempt 1	
2022	
Submission View	
Multiple Choice Questions	
Question 1 1/1 pc	ooint
Which of the following state transitions is <u>not</u> possible in the lifetime of a process?	
Running → Waiting	
○ New → Ready	
Running → Terminated	
<ul><li>Waiting → Running</li></ul>	
Question 2 1/1 pc	ooint
The transition Running → Ready happens when:	
The process is waiting for an I/O event to happen	
An interruption has been caused by an event independent of the process	
The process is completed	
The process is in the busy-waiting state	
Question 3 1 / 1 pc	ooint
Which of the following statements is correct about short term and long term scheduler?	
Cong-term scheduler is invoked as frequent as the short-term scheduler	
Short-term scheduler is invoked very infrequently	
Short-term scheduler is invoked very frequently	
Clong-term scheduler is invoked very frequently	
Question 4 1/1 pc	ooint
The fork() system call in Unix:	
all of the above	
creates new process with the duplicate process_id of the parent process	
creates new process with the duplicate address space of the parent	
creates new process with a shared memory with the parent process	
Question 5 1/1 pc	ooint
How many processes are <u>created</u> at the end of the following for loop?	
for(i=0; i<5; i++) fork();.	
○ 32	
<b>0</b> 5	
<b>24</b>	
<ul><li>31</li></ul>	
Question 6 1/1 pc	ooint
What is the motivation for threads, which does not apply to processes?	
Low overhead in switching between the threads	
All of the above	
One thread handles user interaction while the other thread does the background work	

Question 7	1 / 1 point
Response time refers to the amount of time	
needed to execute a particular process	
that CPU utilization is minimized	
a process has been waiting in the ready queue	
it takes from when a request was submitted until the first action is produced	
Question 8	1 / 1 point
An I/O-bound process	
infrequently requests I/O operations and spends more of its time performing computational work	
infrequently requests I/O operations and spends less of its time performing computational work	
frequently requests I/O operations and spends most of its time performing computational work	
frequently requests I/O operations and spends less of its time performing computational work	
requests (equests ) of operations and species is so its time performing computational work	
uestion 9	1 / 1 point
Throughput is	
the number of processes that complete their execution per time unit	
the number of processes that are pushed into the ready queue per time unit	
the number of I/O-bound processes that utilize the CPU per time unit	
the number of processes that transit from ready state to running state	
uestion 10	1 / 1 point
Which of the following statement defines Preemptive Shortest Job First (SJF)?	_, _ <b>,</b> _,
If a new process arrives with higher priority than the current executing process and a smaller CPU burst length, particular current executing process	preempt the
If a new process arrives with CPU burst length less than the CPU burst length of the current executing process, I	
current executing process	preempt the
<ul> <li>If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process</li> </ul>	
If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre	
If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process      If a new process arrives with higher priority than the current executing process, preempt the current executing process.	
<ul> <li>If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> </ul>	eempt the current
If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with CPU burst length less than the remaining time of the current executing process, preempt the current executing process.	eempt the current
If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with CPU burst length less than the remaining time of the current executing process, preempt the current executing process.	eempt the current
If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process  If a new process arrives with higher priority than the current executing process, preempt the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with CPU burst length executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process.  If a new process arrives with higher priority than the current executing process.  If a new process arrives with higher priority than the current executing process.  If a new process arrives with higher priority than the current executing process.	eempt the current
<ul> <li>If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing puestion 11</li> <li>In Round-Robin scheduling, the quantum length</li> <li>Must be equal or larger than the typical CPU burst length</li> <li>Must be shorter than the typical CPU burst length</li> </ul>	eempt the current
<ul> <li>If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with CPU burst length</li> <li>Must be equal or larger than the typical CPU burst length</li> <li>Must be at least half of the typical burst length</li> <li>None of the above</li> </ul>	process  0 / 1 point
<ul> <li>If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre-executing process</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with CPU burst length</li> <li>Must be equal or larger than the typical CPU burst length</li> <li>Must be at least half of the typical burst length</li> <li>None of the above</li> </ul>	eempt the current
<ul> <li>If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre-executing process</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with higher priority than the current executing process, preempt the current executing process.</li> <li>If a new process arrives with CPU burst length</li> <li>Must be equal or larger than the typical CPU burst length</li> <li>Must be at least half of the typical burst length</li> <li>None of the above</li> </ul>	process  0 / 1 point
If a new process arrives with CPU burst length less than the remaining time of the current executing process, pre executing process  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process, preempt the current executing process.  If a new process arrives with CPU burst length executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.  If a new process arrives with higher priority than the current executing process, preempt the current executing process.	process  0 / 1 point

3 sur 8

Scheduling algorithms for each queue	
Number of queues	
None of the above	
Question 14	1 / 1 poir
In a CPU scheduling algorithm, three queues are used (Q2, Q1, and Q0). Q0 has the highest priority whereas	•
If the scheduling algorithm is multi-level feedback queue, which of the following statements is correct?	
If Q2 is empty, the processes from Q0 are selected.	
○ If Q2 is empty, the processes from Q1 are selected.	
If Q0 is empty, the processes from Q1 are selected.	
If Q1 is empty, the processes from Q0 are selected.	
Nucrtica 15	1 / 1 noi:
Question 15  In multi-processor scheduling, processor affinity can be guaranteed by	1 / 1 poir
keep processes running on the same physical CPU	
keep processes alternating on the multiple physical CPUs	
have processes run on the physical CPU with lowest throughput	
have processes run on the physical CPU with highest throughput	
Question 16	1 / 1 poir
In priority scheduling,	
The processes at the same priority level can be handled via First-Come-First Serve scheduling	
support for real time processing is allowed	
All of the above	
The processes at the same priority level can be handled via Round Robin scheduling	
Question 17	1 / 1 poir
In scheduling, the term "aging" involves	
higher priority processes preventing low-priority processes from ever getting the CPU	
oprocesses being stuck in ready queues so long that they die	
oprocesses that are ready to run but stuck waiting indefinitely for the CPU	
gradually increasing the priority of a process so that a process will eventually execute	
Question 18	0 / 1 poi
In CPU scheduling, the term waiting time denotes the amount of time	o / 1 po
it takes from when a request was submitted until the first response is produced	
a process has been waiting in the wait state	
a process has been waiting in the ready queue	
from job submission to its completion	
Question 19	1 / 1 poir
In RR scheduling, the time quantum should not be the context-switch time.	
○ large with respect to	
small with respect to	
the same size as	
irrelevant to	
Question 20	1 / 1 poir

Context switching between processes is carried out by the	
short term scheduler	
dispatcher	
thread manager	
interrupt handler	
oblem Solving Questions	

Consider the following set of processes, with the length of the CPU burst given in milliseconds. In the last column, 0 denotes the

Process	Arrival Time (ms)	Burst Time (ms)	Priority
P1	0	10	2
P2	3	3	1
P3	4	2	0
P4	5	3	0
P5	6	5	1

Draw three Gantt charts that illustrate the execution of these processes using FCFS, <u>preemptive</u> Shortest Job First (SJF), and priority scheduling with round robin (quantum = 2) scheduling algorithms.

The preemptive SJF does not use the priority to make its decision.

highest priority whereas 2 denotes the lowest priority level.

\*\*\*\*To avoid confusion here: If a process of highest priority is currently scheduled, and another process of the highest priority class arrives, newly arriving process MUST WAIT UNTIL THE END OF THE QUANTUM OF THE ACTIVE PROCESS. If a process of a lower priority class is currently scheduled, and a process of higher priority class has arrived, the newly arriving process CAN PREEMPT THE ACTIVE PROCESS WITHOUT WAITING UNTIL THE END OF THE QUANTUM.\*\*\*\*

Question 21 2 / 2 points

In the FCFS algorithm, find the time when each process ends.
